THE DESIGN UPGRADE TOOLKIT

Fix Your Vibe-Coded App

Most AI-generated apps (from Cursor, v0, Bolt, Claude) look unmistakably amateur: stiff transitions, stock fonts, zero layout hierarchy, and generic buttons. Here are the 4 free secret sites top designers use to turn prototypes into $10M venture-backed interfaces.

godly.design

Curated gallery of the best-designed web apps, agency portfolios, and SaaS landing pages on the internet.

⤢ transitions.dev

43+ copy-paste micro-interactions and Framer Motion transitions with a native Claude Code agent skill.

✿ animos.app

Turn static screenshots into cinematic 3D product launch videos in seconds without After Effects.

☺ deck.gallery

200+ actual pitch decks and slide layouts from OpenAI, Perplexity, Stripe, Airbnb, and Uber.

Quick Reference Directory

DIRECT LINKS

Bookmark these 4 essential resources. Each tool targets a specific flaw common to AI-generated "vibe-coded" frontends:

Tool	Direct URL	What It Fixes	Skill / Integration
1. Godly	`https://godly.design`	Generic, boring layouts & cookie-cutter SaaS aesthetics	Filter by animation, typography, grid
2. Transitions.dev	`https://transitions.dev`	Stiff, jerky, linear animations and missing micro-feedback	`npx skills add Jakubantalik/transitions.dev`
3. Animos	`https://animos.app`	Boring static screenshots on Product Hunt, Twitter & LinkedIn	Browser-based 3D motion templates
4. Deck Gallery	`https://deck.gallery`	Amateur investor pitch decks and client presentations	Real teardowns from OpenAI & Perplexity

What Does "Vibe-Coded" Mean?

When developers prompt AI agents (Cursor, Claude Code, Lovable, v0) to generate frontends, the AI defaults to predictable visual clichés:

- **Purple/Blue Gradient Blobs:** Standard background gradients that scream generic Tailwind AI output.
- **Identical Border Radii & Cards:** Every container has `rounded-lg` with a harsh 1px grey border and zero visual depth.
- **Linear CSS Transitions:** Clunky `transition: all 0.2s ease` that feels mechanical rather than native.
- **No Micro-Feedback:** Buttons that click with zero physical recoil, modals that pop in without origin points, and state changes that jump abruptly.

> **Pro Tip:** Professional product design isn't about complex 3D graphics—it's about *rhythm, typography hierarchy, and physics-based micro-interactions*.

01. Godly • Design Inspiration

SITE #01

`Visit: https://godly.design ↗`

What It Does: Godly is the gold standard gallery for modern web design. While Dribbble is filled with unbuilt Figma concepts, Godly only features *live, production websites* handpicked daily from top design agencies, startups, and creative developers.

How to Use It to Fix Your App:

- **Study Spacing Tokens:** Notice how top agency sites use generous whitespace (e.g., 96px - 140px section padding) rather than cramped elements.
- **Steal Typography Pairs:** Modern sites combine geometric sans-serifs (Plus Jakarta Sans, Inter, Geist) with subtle monospace accents for numbers and metadata.
- **Inspect Real CSS:** Open Chrome DevTools on any Godly featured site to inspect their exact `box-shadow` layers and backdrop-filter settings.

02. Transitions.dev • Micro-Interactions

SITE #02

`Visit: https://transitions.dev ↗`

What It Does: A curated open-source library of 43+ production-ready CSS and Framer Motion micro-interactions (origin-aware modals, springy notification badges, digit counter flips, card stack hovers) created by designer Jakub Antalik.

Install Directly as a Claude Code Agent Skill:

```
# Install all transitions into Claude Code / Agent CLI npx skills add Jakubantalik/transitions.dev # Or add a specific transition directly to your project: npx transitions-dev add card-resize npx transitions-dev add --free
```

Prompt Claude Code to Implement Polish:

"Refactor our modal dialog and card hover effects using the origin-aware transition pattern from transitions.dev. Ensure smooth transform scaling, spring easing, and full @media (prefers-reduced-motion) accessibility support."

03. Animos.app • Launch Videos

SITE #03

`Visit: https://animos.app ↗`

What It Does: Turns static app screenshots and screen recordings into high-converting 3D launch videos. No After Effects, no keyframe timing, and no expensive motion design agencies required. Everything renders right in your browser.

The 3-Step Launch Video Blueprint:

1. **Capture High-Res Screencasts:** Record your key user flow (e.g., uploading a file, generating an AI output) using CleanShot X or native screen recording at 2× retina scale.
2. **Import to Animos:** Select an isometric device frame (MacBook Pro, iPhone 16 Pro, or borderless browser window).
3. **Apply Camera Moves:** Pick dynamic zooms, tilt rotations, and smooth cursor click animations. Export directly to 4K MP4 for Twitter/X, LinkedIn, and Product Hunt.

04. Deck.gallery • Real Pitch Decks

SITE #04

`Visit: https://deck.gallery ↗`

What It Does: An archive of 200+ actual, real-world pitch decks and presentation layouts from top tech giants and venture-backed unicorns—including **OpenAI, Perplexity Ads, Stripe, Uber, and Airbnb**.

How to Steal Layouts for Your Next Pitch:

- **The Problem/Solution Slide:** Study how Perplexity articulates market disruption using minimal copy and high-impact comparative typography.
- **Metrics & Cohort Grids:** See how Stripe and Uber present ARR, churn, and retention rates cleanly without overwhelming the viewer.
- **Visual Consistency:** Observe how multi-billion dollar startups limit each slide to a single core takeaway.

5 Rules to De-Amateurize Any AI App

GOLDEN RULES

Apply these 5 tactical adjustments to your codebase today to instantly remove the "vibe-coded" feel from any AI-generated web application:

1. Strict 8-Point Spacing Rhythm

Never use arbitrary margin/padding like `p-[13px]` or `m-[7px]`. Stick strictly to an 8px grid: `8px (p-2), 16px (p-4), 24px (p-6), 32px (p-8), 48px (p-12), 64px (p-16)`. Consistency in spacing creates subconscious visual balance.

2. Multi-Layer Ambient Shadows Over Harsh 1px Borders

Amateur apps use harsh borders: `border border-slate-300`. Elite designs use layered diffused box-shadows: `box-shadow: 0 4px 6px -1px rgba(0,0,0,0.04), 0 10px 25px -5px rgba(0,0,0,0.06)` with subtle border tints `border border-slate-200/60`.

3. The 3-Level Typography Scale

Limit your page to 3 distinct type scales: **Title (28-36px bold)**, **Body (14-15px medium, line-height 1.5)**, and **Metadata/Labels (11-12px uppercase tracking-wider)**. Avoid using 6 different font sizes across one card.

4. Physics-Based Spring Easing

Replace linear transitions with spring curves. Instead of `transition: all 0.2s ease`, use cubic-bezier curves like `cubic-bezier(0.16, 1, 0.3, 1)` or Framer Motion springs: `type: "spring", stiffness: 400, damping: 30`.

5. Replace Stock Placeholders with Real Domain Data

Never show "Lorem ipsum" or "Card 1". Use realistic customer names, real pricing numbers, authentic logo marks, and realistic timestamps to make the app feel alive in user demos.
